

Semantic Intelligence™ Solution with Risk Distance™ Analysis

Data Risk Monitoring and Protection Without Rules or Policy Management

Concentric MIND

Centralized deep learning as-a-service for fast, accurate identification of business-critical data without complex rules or upfront configuration

Risk Distance

Autonomous risk analysis based on peer file comparisons to spot security concerns without rules or end-user involvement

User 360 Analysis

Identify access and usage patterns by specific individuals for complete protection of sensitive data

Introduction

The Semantic Intelligence™ deep learning solution autonomously protects data by discovering and categorizing structured and unstructured content, identifying business and privacy-sensitive data and finding risk from inappropriate sharing or activity so you can quickly remediate issues and prevent data loss. Our Risk Distance™ analysis compares each file to the baseline security practices in use by each category to autonomously identify risk without the rules and policies other solutions require. Concentric's User 360 capabilities identify inappropriate user activities and data interactions to stop insider threats and proactively prevent data breaches.

Highlights

- Find data wherever it's stored - in the cloud, on-premises, structured and unstructured
- Gain a risk-based view of data and users
- Automated remediation with file and user activity information to instantly fix urgent issues
- Find risk without rules or formal policies
- Secure SaaS solution, API based, no agents
- No rules, no regex, no policies to maintain
- SOC 2 Type 2 company-wide certification

How It Works

Semantic Intelligence™ automates data governance and security for structured and unstructured content. We use deep learning to capture the collective wisdom of content owners to understand security policies without hard-to-maintain rules or end user classification.

Deep learning organizes data into thematic categories that offer accurate insights into meaning and business criticality. Risk Distance™ analysis uncovers each category's baseline security practices to spot at-risk individual files. Our User 360 capabilities assess risk through a user-centric lens to find activity that can indicate insider threats. The solution reveals inappropriate sharing, risky storage locations or incorrect classification – all without rules or policy configuration.

Concentric is an essential part of Cadence's data security portfolio. We use it to identify all our business-critical data – product documentation, finance reports, contracts etc. Concentric gives us a critical layer of data security intelligence on top of the data protection solutions we already use.

*Sreeni Kancharla, CISO
Cadence Design Systems*

Semantic Intelligence is a secure SaaS solution with API connections for data intake (cloud storage, internal file servers, databases), and it integrates with other solutions to make them more effective while reducing overhead.

Autonomous Data Discovery

Effective data access governance starts with accurate and continuous data discovery and categorization. Our sophisticated natural language processing capabilities (a type of deep learning) autonomously group data into over

175 categories, revealing privacy-sensitive data, intellectual property, financial information, legal agreements, human resources files, sales strategies, partnership plans and other business-critical information hidden in your structured and unstructured data. We discover and categorize data without rules, regular expressions, user input, or IT staff overhead.

Risk Dashboard

Risk Distance Analysis

Collectively, the security practices in use within a data category accurately reflect the best judgment of the content owners. Risk Distance identifies risk by calculating the distance from the category's security baseline to each individual data element. Risk distance finds inappropriate sharing, incorrect group membership or access control settings, unclassified regulated content, inappropriate file locations that place sensitive data at risk of loss. Risk distance also offers insights into users and file usage to better understand whether an at-risk file is also in active use and may need urgent attention.

Inappropriate External Sharing

Concentric MIND

Centralized MIND, a deep-learning-as-a-service capability, improves categorization coverage and speeds model adaptation by aggregating intelligence across Concentric customers.

MIND curates all of Semantic Intelligence's deep learning models (whether developed by Concentric or customers) to offer the best-fitting model to every customer when they need it. Shared models are entirely mathematical and do not contain source data to ensure customer privacy and security.

Inappropriate Internal Sharing

Remediation Options

Concentric Semantic Intelligence™ remediates risk by leveraging security management mechanisms already in use at most organizations, allowing you to choose the remediation options that best fit your organization's needs.

Our solution can automatically classify documents, change entitlements, or adjust access controls based on risk. Integrations with data loss prevention (DLP) products or document metadata management approaches like Microsoft Information Protection (MIP) enable far more effective protection as a result.

Not Classified as Having PII

User 360

User 360 offers a user-centric view of each file accessible by a specific employee. Quickly establish usage patterns, spot inappropriate access and find risky sharing patterns. Compare a user's access and sharing practices with similar users, spot personal email sharing and understand what privacy-sensitive content each user can access. User 360 proactively protects against insider threats without rules or hard-to-maintain policies.

User 360

Architecture

Concentric Semantic Intelligence™ Solution

Broad Connectivity

Concentric Semantic Intelligence™ offers API connectivity to securely scan unstructured data wherever it's stored: on-premises, in cloud-based storage solutions, or in structured databases. With support for PostgreSQL, Office365, OneDrive, SharePoint Online, Google Drive, Box, Dropbox, Amazon S3, Windows file shares, MySQL and more ([click here for current list](#)). Continuous autonomous monitoring ensures your data is constantly protected and compliant.

Powered By Deep Learning

Data Discovery and Categorization

Natural Language Processing

- Sentence, paragraph and document analysis
- Discover thematic categories and establish file peer groups
- Accurate, autonomous, no rules or complex configurations

Risk Exposure Assessment

Risk Distance™ Analysis

- Compare file security practices to peer group
- Identify at-risk files
- Spots file-based, activity-based and user-based risk factors

Model Management

Concentric MIND

- Centralized model management
- Curated delivery of best-fit model for any cluster
- Manages customer-derived and Concentric-developed models

Use Cases

About Concentric

- Venture funded by top Silicon Valley VCs
- A secure SaaS solution, API driven
- SOC 2 Type 2 certified

As a SaaS solution, it's easy to give us a try using your own data. Contact us today for a free risk assessment and we'll help you plan your next data privacy move.
